ECLIPSE TIMELINE

MONDAY, AUGUST 21, 2017

10:22 A.M.

The moon touches the sun's edge. Use your glasses or another filter to safely watch.

10:23-11:41 A.M.

Over the course of these 80 minutes, the moon appears to take an ever-growing bite from the sun. Beads of light will shine, temperatures cool, and the sky gradually darkens.

11:42 A.M.

The eclipse approaches totality. Beads of light dance around the sun.

11:43 A.M.

The eclipse reaches totality. Remove your glasses for the next magical 2 minutes and 26 seconds. If you can pull your eyes away from this spectacle, notice the orange horizon that surrounds you.

11:45 A.M.

Totality ends. Put your glasses back on to see the moon's journey back across the sun.

1:09 P.M.

The moon is completely out of the sun's shadow.

A FEW THINGS TO REMEMBER:

- *You don't have to go anywhere!* As long as you can step outside and see the sun you have a great location (unless there is cloud cover at that time).
- Make sure you have **sunscreen**, a comfortable **chair** and **bug spray**. You will be outside for about 1 ½ hours.
- Make sure you have **water** and **snacks** with you.
- This might be a great time to meet and **get to know your next door neighbors**.

**NEVER LOOK DIRECTLY INTO THE SUN
WITHOUT PROTECTION**
